

ABSTRACT

The present invention relates to a transmission-reception system comprising a transmitter (12) configured to transmit digital data including a plurality of useful data as well as first auxiliary data associated with the useful data, and a receiver (14) configured to receive the digital data, having an output (58), at which useful data are able to be provided, wherein the first auxiliary data includes at least one first location-specific characteristic parameter; and the receiver (14) further includes a location specification unit (40), in which at least a second location-specific characteristic parameter is specifiable, and a feature association unit (52) associating a feature with the useful data, which corresponds to the degree of correlation of the first location-specific characteristic parameter contained in the associated auxiliary data with the second location-specific characteristic parameter. It further comprises a suitable transmitter (12) and a suitable receiver (14) as well as a corresponding method for transmitting digital data.
